

Highlights

- A smarter way to secure and enable endpoints, end users and everything in between
 - Efficiently manage diverse devices, including laptops, desktops, smartphones, tablets, wearables and Internet of Things (IoT) devices
 - Support all major platforms including Apple iOS and macOS, Google Android, and Microsoft Windows
 - Provide broad Microsoft support, from legacy Microsoft Windows XP SP3 to the modern Microsoft Windows 10
 - Unify endpoint visibility, management and security with a single console
 - Identify risks, opportunities and efficiencies with insights and analytics from IBM® Watson® cognitive technology and IBM X-Force® threat intelligence
-

IBM MaaS360 with Watson

A cognitive approach to unified endpoint management

While it might be desirable to standardize end users on one or two types of devices that all run the same operating system, most organizations don't have that luxury. Today's users demand an extraordinary level of flexibility and convenience—which means most organizations support a vast assortment of endpoints, including laptops and desktops (both PCs and Macs), tablets and hybrid devices, smartphones, and even wearables and IoT devices.

Not only do employees use a variety of form factors, but they run a variety of platforms on those devices, including iOS and macOS, Android, and Windows.

To complicate the situation further, they run different versions of those platforms—for example, they may run Windows XP SP3, Windows 10, or anything in between.

To wrangle these mixed-device environments, many organizations end up relying on various point solutions to get the job done (e.g., a combination of mobile device management [MDM] and client management tools). These tools generally don't integrate with each other, don't provide a consolidated view of device security status and user activity, and don't allow IT administrators to consistently apply and enforce management policies. The solution? Unified endpoint management (UEM)—with a smarter approach that allows IT administrators to consolidate management of all types of devices, regardless of form factor, platform or operating system version.

IBM MaaS360 with Watson for cognitive UEM

IBM MaaS360® provides a cloud-based, comprehensive UEM solution that helps IT organizations manage and secure a heterogeneous pool of endpoints, end users, and everything in between—including their applications, content and data.

MaaS360 delivers robust UEM capabilities across all major computing platforms, including iOS, macOS, Android and Windows devices. And where competing solutions offer incomplete support for legacy Microsoft platforms, MaaS360 supports Windows XP SP3, Microsoft Windows Vista, Microsoft Windows 7, Microsoft Windows 8, Windows 10 and Microsoft Windows 10 Mobile. These capabilities include:

- Identity and access management (IAM) that allows a shift from a device-based context to a more comprehensive, user-based context
 - Application management, including an intuitive, universal application catalog for iOS, macOS, Android and Windows, advanced bundling and promotion features, bulk application purchase and distribution capabilities, and fine-grained data controls
 - A user-friendly, encrypted container to secure corporate email, web browsing and application data
 - Insights and analytics from IBM Watson cognitive technology and IBM X-Force threat intelligence
- Detection and defense against malware and advanced threats with automated remediation capabilities
 - Management and security of specialized use cases for wearables, ruggedized devices and the IoT

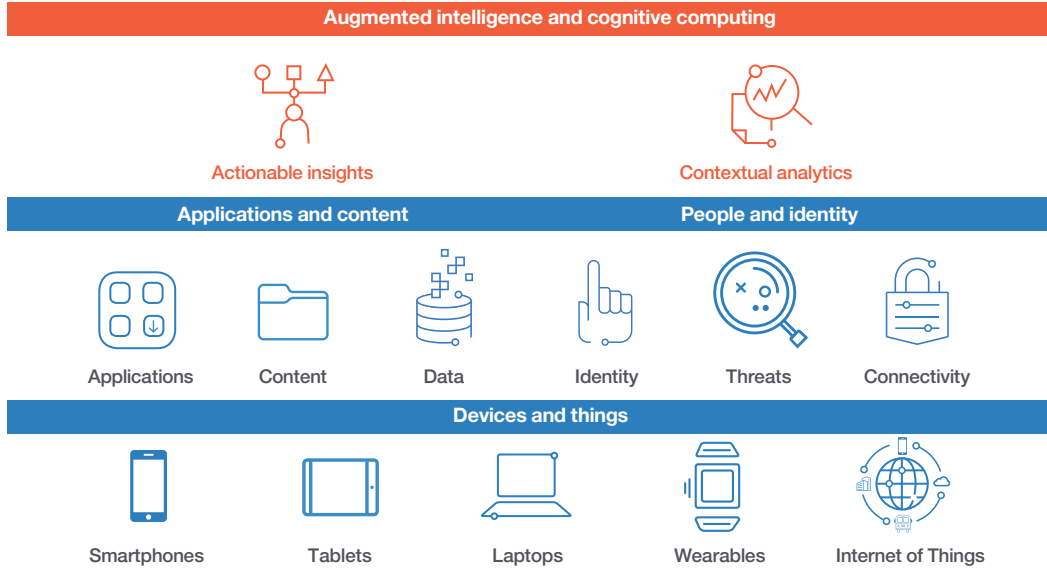

MaaS360 provides not only a single pane of glass for consistent endpoint visibility, reporting and analytics across diverse form factors, but also a single management console that consolidates endpoint management tasks across all devices, whether they are managed by application programming interface (API) sets, agents or both.

MaaS360 also provides:

- Robust security capabilities, including an automated enforcement rules engine
- Reporting dashboards and inventory capabilities for endpoints and their associated applications
- Granular control over operating system and software patching policies, allowing IT administrators to customize maintenance and management of legacy devices

As an exclusively cloud-based offering, MaaS360 facilitates fast deployment, helps minimize your endpoint management footprint and costs, and ensures that you always have the latest software versions, including updated code as platform vendors release expanded APIs.

Cognitive unified endpoint management

Converging APIs and agents

Thanks to API sets for iOS, macOS, Android and Windows 10, managing the devices that run on those platforms is far easier and more efficient than traditional agent-based client management. But legacy devices and platforms still require the agent-based approach to ensure they stay patched, updated and securely under IT control. In some cases, the most effective approach is to use both methods in tandem—a hybrid of API sets and agents. MaaS360 converges both methods, allowing organizations to leverage a single solution to manage all endpoints.

For those in IT management and security that are still supporting legacy Windows devices such as Windows 7-based laptops, MaaS360 allows a simple, seamless transition to Windows 10, eliminating the need to phase out old management tools and replace them with new ones. Thanks to Microsoft APIs for Windows 10, organizations can use MaaS360 to more easily migrate from traditional agent-based device management to API device management—all with one platform.

The IBM MaaS360 with Watson difference

While alternative solutions provide incomplete coverage across computing platforms, MaaS360 delivers cognitive UEM across all endpoint types including smartphones, tablets, laptops, desktops, devices designed for the IoT, ruggedized devices and wearables. And while competing solutions provide incomplete coverage of Windows devices, MaaS360 can support the full spectrum, from Windows XP SP3 to Windows 10.

Traditional mobile device management systems were built in a simpler time for tactical purposes and disparate mobility projects. With the industry's first cognitive UEM platform, MaaS360 with Watson delivers a single, strategic management and security solution to drive your organization's digital business transformation.

MaaS360 delivers powerful insights and analytics from Watson cognitive technology, IBM X-Force Exchange threat intelligence and cloud-sourced benchmarking data from the MaaS360 platform.

Insights and analytics from MaaS360 with Watson can help organizations maximize their return on investment for their mobile strategies—and realize it faster—by identifying business opportunities, increasing workforce productivity, boosting IT operations efficiency, minimizing security risks and helping the

business make more informed endpoint decisions, including spending decisions. MaaS360 insights and analytics include three key capabilities:

- **Advisor**, which delivers actionable intelligence that is contextual to the organization
- **Mobile Security Index**, which provides the industry's first publicly available mobile security scorecard
- **Mobile Metrics**, which offers the industry's first cloud-sourced endpoint benchmarking data

As part of the larger IBM Security portfolio, MaaS360 also provides key IBM technology integrations with solutions such as IBM BigFix®, IBM QRadar® SIEM, IBM Trusteer® and IBM Security Access Manager to maximize your IT investments.

MaaS360 solution editions are right-sized to fit your enterprise needs.

MaaS360 solution editions

The MaaS360 product family offers a broad range of solution editions that provide organizations with comprehensive, secure and efficient unified endpoint management capabilities to best fit their needs. It is available in the following editions: Essentials, Deluxe, Premier and Enterprise—the details for which can be found on [IBM Marketplace](#).

Why IBM?

MaaS360 makes it possible to use one platform to manage all devices with a cognitive approach with Watson. Whether they use APIs or agents, MaaS360 unifies management activities across all devices throughout the enterprise, while enabling a hybrid approach where applicable. MaaS360 protects endpoints—plus their applications, content and data—to improve the overall security posture of the IT infrastructure, while at the same time increasing the organizational efficiency and reducing IT management costs. A consolidated approach also enhances the end-user experience, from initial deployment through device decommissioning.

About IBM Security

IBM Security offers one of the most advanced and integrated portfolios of enterprise security products and services. The portfolio, supported by world-renowned X-Force research, provides security intelligence to help organizations holistically protect their infrastructures, data and applications, offering solutions for identity and access management, database security, application development, risk management, endpoint management, network security and more. These solutions enable organizations to effectively manage risk and implement integrated security for mobile, cloud, social media and other enterprise business architectures. IBM operates one of the world's broadest security research, development and delivery organizations, monitors 15 billion security events per day in more than 130 countries, and holds more than 3,000 security patents.

Additionally, IBM Global Financing provides numerous payment options to help you acquire the technology you need to grow your business. We provide full lifecycle management of IT products and services, from acquisition to disposition. For more information, visit: ibm.com/financing
